A study was made using phenol plus water for separating hydrocarbons from benzene fractions in the 60-110°C. range. During these studies it was found that phenol with 5% H₂O worked best. The method is as follows: A number of close boiling fractions (2°C.) are arranged in a series so that the fraction with the lowest density becomes the first member of the series and (Engineering--Chemical, TT, v. 10, no. 2) (over)
